

Seed the database

Sergio Revilla
@elrepicante

based on Martin Tschischauskas (@martynasc) slides

Or...

the Rails way to have testing
data for development

db/seeds.rb

```
# This file should contain all the record creation needed to seed the database with its
# default values.
# The data can then be loaded with the rake db:seed (or created alongside the db with
# db:setup) .
#
# Examples:
#
#   cities = City.create([ { name: 'Chicago' }, { name: 'Copenhagen' } ])
#   Mayor.create(name: 'Emanuel', city: cities.first)
```

db/seeds.rb

```
Location.create name: 'Home', city: 'Barcelona'
```

```
Location.create name: 'Beach'
```

```
Location.create name: 'Hotel', city: 'Madrid'
```

```
$ rake db:seed
```

```
$ rake db:drop db:create db:migrate db:seed
```

```
$ rake db:drop db:setup
```

```
$ rails c
```

```
> Location.count
```

Exercise #13

Fill the seeds file with 3 different location creation statements
