

Design Pattern, MVC

Sergio Revilla @elreplicante

Software Design Patterns

- general reusable solution
- to commonly occurring problems
- description or template to solve a problem

MVC - Pattern

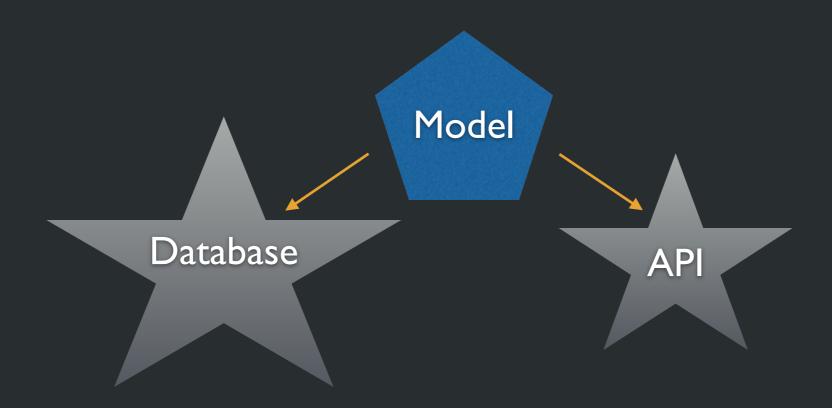

- Model
- View
- Controller

Model

Internal Representation of Logic

- application data
- business rules
- logic
- functions

View

any output representation

View

- requests information from the model
- generates output representation

Controller

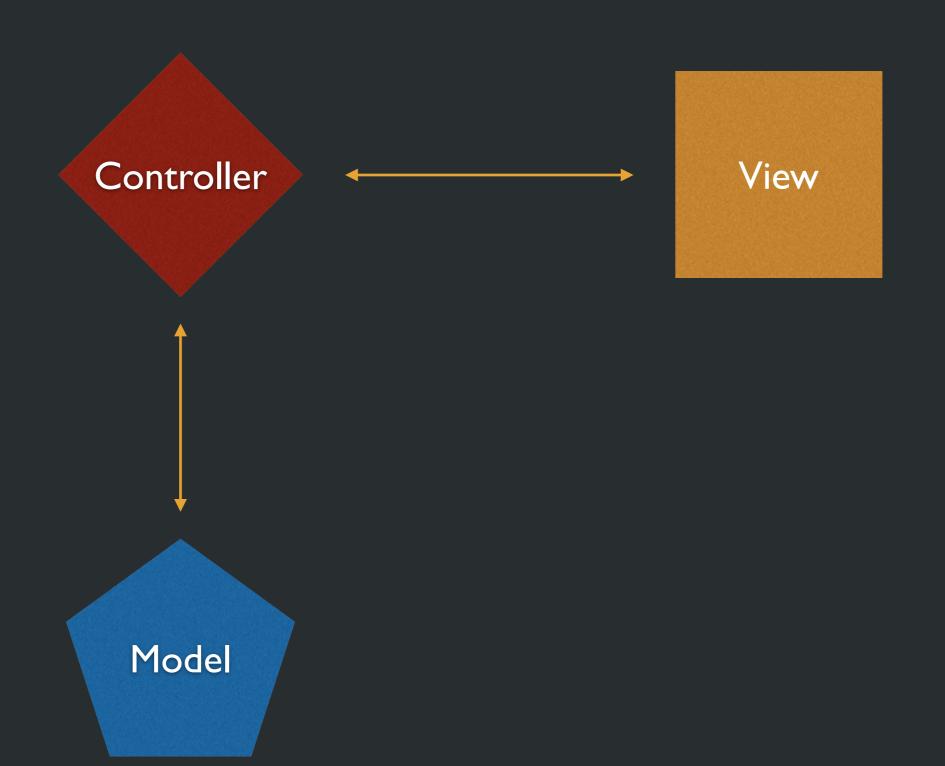

interaction between model and view

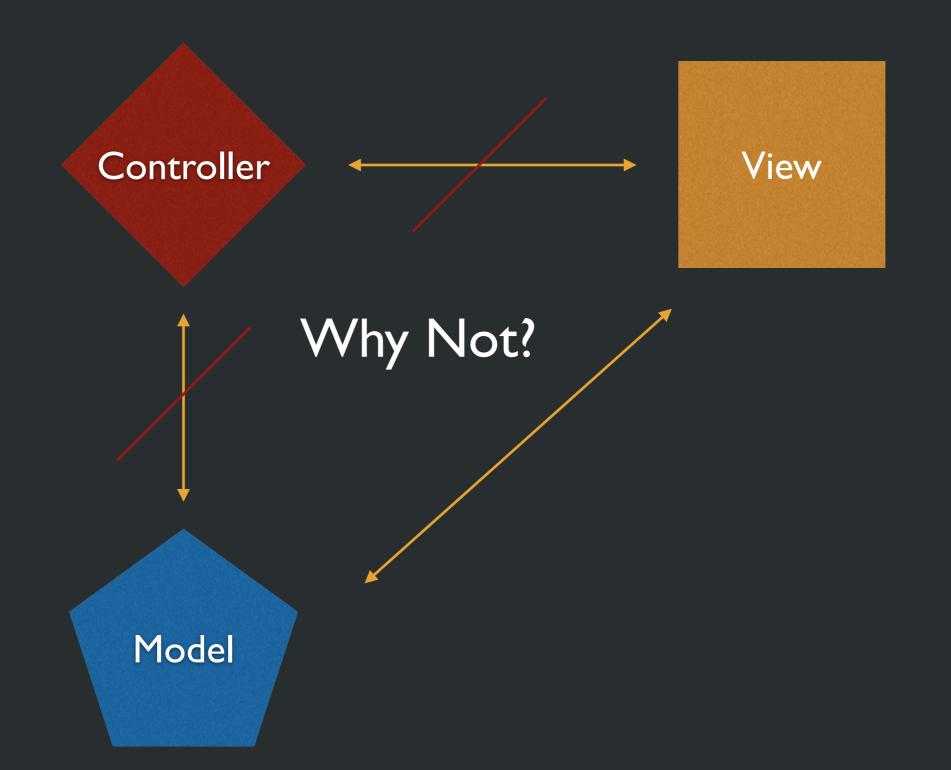

- accepts input
- converts it to commands
- for the model or view

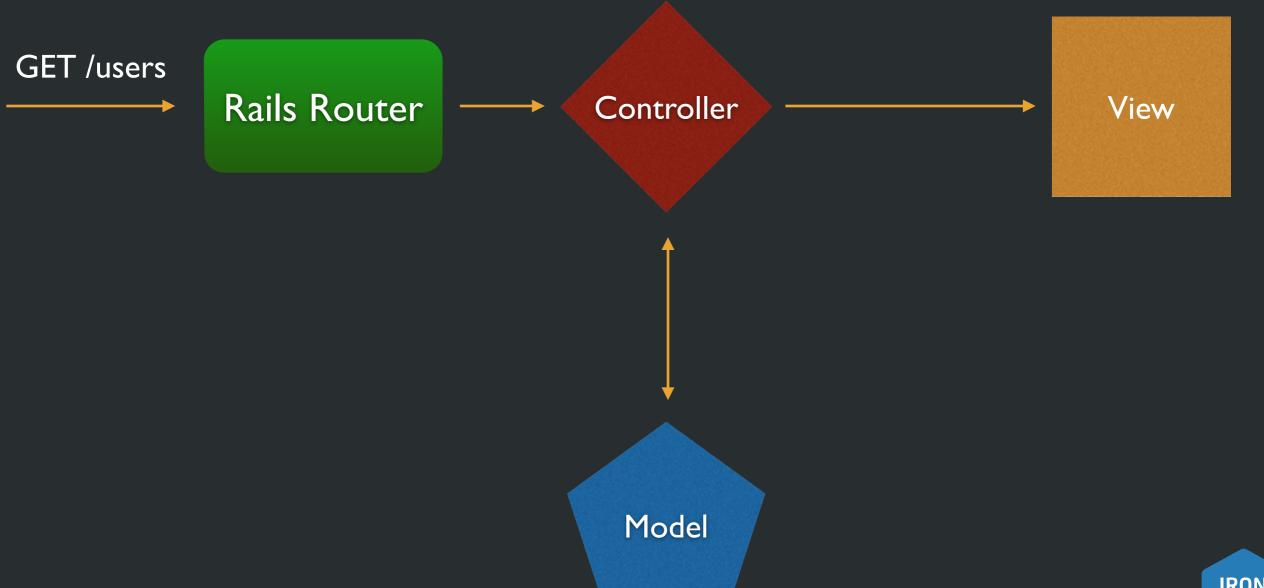

Why not MY?

- avoids coupling
- easy to exchange parts
- view can be "stupid"

In Ruby on Rails

First Controller

\$ rails g controller home

app/controllers/home_controller.rb

app/controllers/home_controller.rb

```
class HomeController < ApplicationController
  def welcome
    render "welcome"
  end
end</pre>
```

config/routes.rb

```
get 'home' => 'home#welcome'
```

app/views/home/welcome.html.erb

```
<h1> Welcome to MeetMe </h1>
```

your place to tell your friends where they can meet you!

Run the server

\$ rails s

Open your Browser

http://localhost:3000/home

Exercise #1

Implement a contact page which will have your contact details

- I. Use the Home Controller
- 2. The page should be reachable under /contact

Exercise #2

Try to remove the execution of render in the home controller

Does the page still work? Why?

Examine the logs, which templates are rendered?

Exercise #3

Change the routes so that the welcome page is the initial page... under

Hint: See comments in routes.rb

Naming Conventions

- Controller Name = view folder name
- Action Name = template file name
 app/views/home/welcome.html.erb
 app/controllers/home_controller.rb
 class HomeController < ApplicationController def welcome end

end
